

ABSTRACT OF THE DISCLOSURE

Power source lines (183) for supplying drive current from power source input terminals (180) to organic EL elements (160) 5 formed in a display pixel region having display pixels are connected by a bypass line (181) along the row direction within the display pixel region. This arrangement minimizes decrease in power source current caused by resistance of the power source lines (183) according to the line length. Accordingly, the organic EL elements 10 (160) can adequately receive the actual desired current, thereby achieving an organic EL device capable of bright displays and having uniform display luminance within the display region.
